

Prelude

For Transparency

This document will be shared publicly including on social media, with media outlets, advocacy groups and the NDP, the official opposition in the Alberta Legislature. People are scared. People are terrified. People are scrambling trying to figure out what they are going to do. Disabled Albertans deserve to know what the plan is. Not releasing information regarding this rollout less than four months before implementation is harmful, particularly when many people affected are already struggling to afford basic necessities.

This analysis is not being shared with the intent of fear mongering. However, when people see the numbers contained in this document, fear is an understandable reaction. Since the announcement of this policy direction the tone within disability communities has shifted from struggle and despair to something closer to hopelessness. Discussions about suicide and Medical Assistance in Dying (MAID) in disability support communities have increased.

Government representatives say there is a plan. If that is the case Albertans deserve to see it. Government representatives say the public supports this approach. If that is the case that support should be demonstrated openly. What many people including advocacy organizations are currently seeing suggests something very different.

For that reason this analysis is being shared publicly. People deserve to understand or at least approximate what their lives may look like if the proposed system is implemented. Disabled Albertans are not second class citizens. Transparency is not optional.

To Premier Danielle Smith

On March 12 you stood in the Alberta Legislature and accused Naheed Nenshi of being unable to do basic math. As Premier of Alberta you have access to economists, accountants and financial strategists who likely earn six figure salaries. Yet since December the only public operational detail released about ADAP has been that the first 700 dollars of earnings will be exempt.

With a tenth grade education I was able to take that single publicly released figure and construct two potential clawback models based on the remaining publicly known anchors of the program. If the Government of Alberta has already completed the full modelling behind ADAP Albertans deserve to see it. Show the public the math.

To Minister Jason Nixon

It is predictable that this analysis may be described as misinformation. It is not. The document repeatedly states that the models are based on publicly available information and that the Government of Alberta has not yet released the full program structure. Where details are unknown clearly labelled hypothetical modelling assumptions are used.

Two different ADAP structures are presented specifically to avoid partisan interpretation and to acknowledge uncertainty where the government has not yet published the full rules. Transparency and evidence are essential to democratic legitimacy.

This prelude section is intentionally not numbered and is not considered part of the analytical report that follows.

The following document contains an independent analysis of the Alberta Disability Assistance Program based on currently available public information.

My Analysis of ADAP Based on Provided Information

By: [REDACTED] [REDACTED]

This document presents an independent analytical model based on publicly available information regarding the current AISH structure, the post-July 1, 2026 AISH design assumptions, and the proposed Alberta Disability Assistance Program (ADAP). Some program parameters have not yet been officially released by the Government of Alberta. Where official details are unavailable, estimated modelling assumptions have been used in order to test how the program interactions could function in practice. These estimates are not official Government of Alberta figures. Information regarding final program parameters has been requested from Premier Danielle Smith and Minister Jason Nixon. Once official program figures are released, a full reassessment of the analysis will be completed.

Executive Summary

This report compares the current AISH structure, a post-July 1, 2026 AISH assumption, and two estimated ADAP phase-out structures. Its purpose is not to claim certainty where official program parameters remain incomplete. Its purpose is to show, as clearly and transparently as possible, how the public figures now available may interact when placed into a consistent monthly model.

The analysis is organized around hourly wages from \$15 to \$20 and work levels of 6, 10, 15, 20, 25, 30, 35, and 40 hours per week. The lower-hour rows matter because they reflect realistic limited work capacity. The higher-hour rows matter because they show where plateau effects and phase-out ladders begin to change the total-income result.

Current AISH tends to provide the strongest protection at lower hours because the first \$1,072 of monthly employment income is fully exempt. The post-July 1, 2026 AISH assumption is materially harsher at low and moderate earnings because it assumes only a \$350 exemption and a 100 percent deduction above that amount. ADAP Model A and ADAP Model B are both included so the analysis does not depend on only one estimated ADAP taper path.

Model A shows a steeper middle-phase taper. Model B shows a more gradual taper that still preserves the same public entry point and the same public annual phase-out point. Because both are included and analyzed on equal footing, the document is less vulnerable to the criticism that it was built around only one speculative scenario.

Color Key and Reading Guide

The same colour is used consistently throughout the document whenever a program structure is discussed. That consistency makes it easier to skim the report and identify which model a table or section refers to.

Color	Used for
Blue	Current AISH
Green	Post-July 1, 2026 AISH assumption
Rose	Estimated ADAP Model A
Lavender	Estimated ADAP Model B
Grey	Comparison and summary tables

Each wage section follows the same order: a brief section introduction, a summary metrics table, a Current AISH table, a Post-July 1, 2026 AISH assumption table, an ADAP Model A table, an ADAP Model B table, a comparison table, and two pages of interpretation. The repeated structure is intentional so the reader can move between wage sections without having to relearn the format.

Current AISH Clawback Structure

Current AISH protects the first \$1,072 of monthly employment income in full. Earnings from \$1,072 to \$2,144 are modelled at a 50 percent clawback rate. Earnings above \$2,144 are modelled at a 100 percent clawback rate.

Income range	Clawback rate
\$0 - \$1,072	0%
\$1,072 - \$2,144	50%
Above \$2,144	100%

Post-July 1, 2026 AISH Assumption

This report models the post-July 1, 2026 AISH structure as a \$1,940 base amount with a \$350 monthly earnings exemption and a 100 percent deduction above that amount. The 100 percent deduction assumption is used because the government has described AISH as being for people who cannot work at all, while final detailed rule tables have not yet been officially released.

Income range	Clawback rate
\$0 - \$350	0%
Above \$350	100%

ADAP Model A Structure

ADAP Model A uses the publicly known \$1,740 base payment, the public \$700 monthly earnings exemption, and the public annual phase-out point of \$45,000, which equals \$3,750 per month. The intermediate 25, 40, 55, 70, and 85 percent rates are estimated for modelling purposes because detailed intermediate government tables have not yet been officially released.

Income range	Clawback rate
\$0 - \$700	0%
\$701 - \$1,310	25%
\$1,311 - \$1,920	40%
\$1,921 - \$2,530	55%
\$2,531 - \$3,140	70%
\$3,141 - \$3,750	85%
Above \$3,750	100%

ADAP Model B Structure

ADAP Model B preserves the same public ADAP anchors but tests a more gradual taper of 15, 30, 45, 60, 75, 90, and 100 percent. The upper public range is split into two sub-bands so the model can include both a 75 percent and a 90 percent taper before full phase-out.

Income range	Clawback rate
\$0 - \$700	0%
\$701 - \$1,310	15%
\$1,311 - \$1,920	30%
\$1,921 - \$2,530	45%
\$2,531 - \$3,140	60%
\$3,141 - \$3,445	75%
\$3,446 - \$3,750	90%
Above \$3,750	100%

Program Structure Overview

Four structures are compared throughout this document. The first is the current AISH structure. The second is a post-July 1, 2026 AISH assumption based on the currently known \$350 exemption. The third is ADAP Model A, which follows the original estimated ladder built from the public ADAP anchors. The fourth is ADAP Model B, which applies a more gradual phase-out path while preserving the same public entry point and the same public annual phase-out point.

Program	Income range	Clawback rate
Current AISH	\$0 - \$1,072	0%
Current AISH	\$1,072 - \$2,144	50%
Current AISH	Above \$2,144	100%
Post-July 1, 2026 AISH assumption	\$0 - \$350	0%
Post-July 1, 2026 AISH assumption	Above \$350	100%
ADAP Model A	\$0 - \$700	0%
ADAP Model A	\$701 - \$1,310	25%
ADAP Model A	\$1,311 - \$1,920	40%
ADAP Model A	\$1,921 - \$2,530	55%
ADAP Model A	\$2,531 - \$3,140	70%
ADAP Model A	\$3,141 - \$3,750	85%
ADAP Model A	Above \$3,750	100%
ADAP Model B	\$0 - \$700	0%
ADAP Model B	\$701 - \$1,310	15%
ADAP Model B	\$1,311 - \$1,920	30%
ADAP Model B	\$1,921 - \$2,530	45%
ADAP Model B	\$2,531 - \$3,140	60%
ADAP Model B	\$3,141 - \$3,445	75%
ADAP Model B	\$3,446 - \$3,750	90%
ADAP Model B	Above \$3,750	100%

Modelling Method and Disclosure

Monthly earnings are calculated using 4.33 weeks per month. The wage scenarios use 6, 10, 15, 20, 25, 30, 35, and 40 hours per week. Current AISH is modelled with a full exemption for the first \$1,072 of monthly employment income, a 50 percent clawback from \$1,072 to \$2,144, and a 100 percent clawback above \$2,144.

The post-July 1, 2026 AISH structure is modelled as a \$1,940 base amount with a \$350 monthly exemption and a 100 percent deduction above that amount. This assumption is used because the government has described AISH as a program intended for people who cannot work at all, while detailed final rule tables have not yet been officially released.

ADAP Model A uses the public \$1,740 base payment, the public \$700 monthly exemption, and the public annual phase-out point of \$45,000, which is equal to \$3,750 per month. ADAP Model B uses the same public anchors but applies a more gradual taper of 15, 30, 45, 60, 75, 90, and 100 percent. Because the public \$45,000 annual phase-out point is preserved, the upper public range is split into two sub-bands in Model B so the model can include a distinct 90 percent taper before full phase-out.

Effective Marginal Clawback Rate

The chart below compares each model's effective marginal rate structure in a form that is easier to understand quickly than a single compressed table.

Estimated ADAP Trigger Ladder

The trigger ladder converts the public annual phase-out point into monthly earnings bands. In monthly terms, the public \$45,000 phase-out point is equal to \$3,750.00. Model A applies the original estimated ladder. Model B preserves the same public anchors but divides the upper public range into two sub-bands so the model can show a distinct 90 percent taper before full phase-out.

Model	Monthly earnings range	Estimated clawback rate
ADAP Model A	\$0 - \$700	0%
ADAP Model A	\$701 - \$1,310	25%
ADAP Model A	\$1,311 - \$1,920	40%
ADAP Model A	\$1,921 - \$2,530	55%
ADAP Model A	\$2,531 - \$3,140	70%
ADAP Model A	\$3,141 - \$3,750	85%
ADAP Model A	Above \$3,750	100%
ADAP Model B	\$0 - \$700	0%
ADAP Model B	\$701 - \$1,310	15%
ADAP Model B	\$1,311 - \$1,920	30%
ADAP Model B	\$1,921 - \$2,530	45%
ADAP Model B	\$2,531 - \$3,140	60%
ADAP Model B	\$3,141 - \$3,445	75%
ADAP Model B	\$3,446 - \$3,750	90%
ADAP Model B	Above \$3,750	100%

In Model A, the 40 percent rate begins at \$1,310.00, the 55 percent rate begins at \$1,920.00, the 70 percent rate begins at \$2,530.00, and the 85 percent rate begins at \$3,140.00. In Model B, the upper public range is split so the model can reflect both a 75 percent taper and a 90 percent taper before full phase-out.

High-Level Policy Interpretation

The main policy question is not only which structure pays the highest total income at a single point in time. It is also how quickly each model moves a worker out of a protected earnings band and into a deductions regime. That is why the detailed wage tables preserve the separate benefit and clawback columns instead of showing only final totals.

Work-capacity profile	Most protective model	Key reason
6-10 hours/week	Current AISH	Large fully exempt band protects low earnings most effectively.
15-25 hours/week	Often Current AISH or close competition	Current AISH still protects lower and middle hours well, but ADAP becomes more competitive as earnings increase.
30-40 hours/week	ADAP Model A or B more often competitive	Current AISH eventually plateaus once the 100 percent clawback zone is reached, while ADAP can continue to rise.

At lower hours, exemption size does most of the work. At moderate hours, the shape of the clawback ladder matters more. At higher hours, current AISH eventually reaches a plateau because the effective 100 percent zone stops further total-income growth. That plateau effect is the main reason the ADAP models can overtake current AISH at higher hours even when current AISH is initially stronger.

Wage Scenario: \$15 per hour

This section preserves the same broad analytical sequence throughout the report. It begins with a short legend and summary metrics, then presents each structure in a dedicated table before moving to comparison and interpretation. The repeated structure is intentional so the reader can move from one wage level to the next without having to relearn the format.

Color	Used for
Blue	Current AISH
Green	Post-July 1, 2026 AISH assumption
Rose	Estimated ADAP Model A
Lavender	Estimated ADAP Model B
Grey	Comparison and summary tables
Metric	Value
ADAP Model A vs current AISH crossover	About 40 hours/week
ADAP Model B vs current AISH crossover	About 35 hours/week
ADAP Model A vs post-2026 AISH assumption	About 9 hours/week
ADAP Model B vs post-2026 AISH assumption	About 9 hours/week
6 hours/week monthly earnings	\$389.70
10 hours/week monthly earnings	\$649.50

At \$15 per hour, 6 hours of work produces \$389.70 per month and 10 hours produces \$649.50. Those rows matter because they represent limited work capacity rather than assuming immediate movement into higher-hour employment.

Current AISH

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$389.70	\$1,940.00	\$0.00	\$2,329.70
10	\$649.50	\$1,940.00	\$0.00	\$2,589.50
15	\$974.25	\$1,940.00	\$0.00	\$2,914.25
20	\$1,299.00	\$1,826.50	\$113.50	\$3,125.50
25	\$1,623.75	\$1,664.12	\$275.88	\$3,287.88
30	\$1,948.50	\$1,501.75	\$438.25	\$3,450.25
35	\$2,273.25	\$1,274.75	\$665.25	\$3,548.00
40	\$2,598.00	\$950.00	\$990.00	\$3,548.00

Current AISH protects the first \$1,072 of employment income in full. Once earnings exceed that amount, the 50 percent band begins, and once earnings move above \$2,144 the effective 100 percent clawback zone creates a practical total-income ceiling.

Post-July 1, 2026 AISH assumption

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$389.70	\$1,900.30	\$39.70	\$2,290.00
10	\$649.50	\$1,640.50	\$299.50	\$2,290.00
15	\$974.25	\$1,315.75	\$624.25	\$2,290.00
20	\$1,299.00	\$991.00	\$949.00	\$2,290.00
25	\$1,623.75	\$666.25	\$1,273.75	\$2,290.00
30	\$1,948.50	\$341.50	\$1,598.50	\$2,290.00
35	\$2,273.25	\$16.75	\$1,923.25	\$2,290.00
40	\$2,598.00	\$0.00	\$2,248.00	\$2,598.00

This model is shown as an assumption rather than a confirmed government table. It keeps the \$1,940 base amount but assumes only a \$350 exemption and a 100 percent deduction above that point, which causes total income to flatten quickly and then track earnings once the benefit is exhausted.

Estimated ADAP Model A

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$389.70	\$1,740.00	\$0.00	\$2,129.70
10	\$649.50	\$1,740.00	\$0.00	\$2,389.50
15	\$974.25	\$1,671.44	\$68.56	\$2,645.69
20	\$1,299.00	\$1,590.25	\$149.75	\$2,889.25
25	\$1,623.75	\$1,462.00	\$278.00	\$3,085.75
30	\$1,948.50	\$1,327.83	\$412.18	\$3,276.32
35	\$2,273.25	\$1,149.21	\$590.79	\$3,422.46
40	\$2,598.00	\$960.40	\$779.60	\$3,558.40

Model A uses the original estimated ladder built from the public \$700 exemption and the public \$45,000 annual phase-out point. Its middle earnings range becomes progressively steeper, which is why the benefit column declines faster as earnings move deeper into the ladder.

Estimated ADAP Model B

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$389.70	\$1,740.00	\$0.00	\$2,129.70
10	\$649.50	\$1,740.00	\$0.00	\$2,389.50
15	\$974.25	\$1,698.86	\$41.14	\$2,673.11
20	\$1,299.00	\$1,650.15	\$89.85	\$2,949.15
25	\$1,623.75	\$1,554.38	\$185.62	\$3,178.12
30	\$1,948.50	\$1,452.67	\$287.32	\$3,401.18
35	\$2,273.25	\$1,306.54	\$433.46	\$3,579.79
40	\$2,598.00	\$1,150.20	\$589.80	\$3,748.20

Model B uses the same public anchors but a more gradual taper. The purpose is not to present it as a confirmed government design. The purpose is to test how a less abrupt phase-out path would change the income interactions if a final ADAP table were designed to reduce middle-range compression.

Comparison Table: Highest Total Income by Hour

Hours / week	Monthly earnings	Highest-income model	Top result	Margin over Current AISH
6	\$389.70	Current AISH	\$2,329.70	\$0.00
10	\$649.50	Current AISH	\$2,589.50	\$0.00
15	\$974.25	Current AISH	\$2,914.25	\$0.00
20	\$1,299.00	Current AISH	\$3,125.50	\$0.00
25	\$1,623.75	Current AISH	\$3,287.88	\$0.00
30	\$1,948.50	Current AISH	\$3,450.25	\$0.00
35	\$2,273.25	ADAP Model B	\$3,579.79	\$31.79
40	\$2,598.00	ADAP Model B	\$3,748.20	\$200.20

The comparison table identifies the model that produces the highest total income at each hour level. The margin-over-current-AISH column is included because current AISH is the most relevant baseline for many readers.

Key Takeaway Chart

The chart below gives a reader-friendly visual summary of the wage section. It shows where current AISH begins strong, where the post-2026 AISH assumption flattens quickly, and where the ADAP models become more competitive as hours increase.

At \$15 per hour, the chart makes the central pattern easier to see: low-hour protection tends to favor current AISH, while middle and higher-hour competitiveness tends to improve under the ADAP models, especially under Model B.

Interpretation and Public-Facing Takeaways

At \$15 per hour, current AISH remains strongest at the lowest hours because the first portion of earnings is fully protected. The post-July 1, 2026 AISH assumption is weaker at low and moderate hours because a worker leaves the protected band after only \$350 per month.

ADAP Model A and ADAP Model B are both lower than current AISH at very low hours in this wage band, but they behave differently once earnings move into the middle and upper rows. ADAP Model A first matches or exceeds current AISH at about 40 hours per week. ADAP Model B first matches or exceeds current AISH at about 35 hours per week.

ADAP Model A first matches or exceeds the post-2026 AISH assumption at about 9 hours per week. ADAP Model B first matches or exceeds the post-2026 AISH assumption at about 9 hours per week.

The main pattern to notice is where income growth slows. In current AISH, that slowdown becomes clear as earnings approach and then move beyond the 50 percent band into the effective 100 percent zone. In Model A and Model B, the slowdown is more gradual because the taper is distributed across a ladder, but the middle rows still matter because that is where clawbacks begin to accumulate meaningfully.

For public scrutiny, the important point is transparency. The tables in this section preserve the separate earnings, benefit, clawback, and total-income columns so the result is numerically auditable rather than impressionistic. That makes the section easier to test, dispute, or refine once more official numbers become available.

Wage Scenario: \$16 per hour

This section preserves the same broad analytical sequence throughout the report. It begins with a short legend and summary metrics, then presents each structure in a dedicated table before moving to comparison and interpretation. The repeated structure is intentional so the reader can move from one wage level to the next without having to relearn the format.

Color	Used for
Blue	Current AISH
Green	Post-July 1, 2026 AISH assumption
Rose	Estimated ADAP Model A
Lavender	Estimated ADAP Model B
Grey	Comparison and summary tables
Metric	Value
ADAP Model A vs current AISH crossover	About 37 hours/week
ADAP Model B vs current AISH crossover	About 32 hours/week
ADAP Model A vs post-2026 AISH assumption	About 8 hours/week
ADAP Model B vs post-2026 AISH assumption	About 8 hours/week
6 hours/week monthly earnings	\$415.68
10 hours/week monthly earnings	\$692.80

At \$16 per hour, 6 hours of work produces \$415.68 per month and 10 hours produces \$692.80. Those rows matter because they represent limited work capacity rather than assuming immediate movement into higher-hour employment.

Current AISH

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$415.68	\$1,940.00	\$0.00	\$2,355.68
10	\$692.80	\$1,940.00	\$0.00	\$2,632.80
15	\$1,039.20	\$1,940.00	\$0.00	\$2,979.20
20	\$1,385.60	\$1,783.20	\$156.80	\$3,168.80
25	\$1,732.00	\$1,610.00	\$330.00	\$3,342.00
30	\$2,078.40	\$1,436.80	\$503.20	\$3,515.20
35	\$2,424.80	\$1,123.20	\$816.80	\$3,548.00
40	\$2,771.20	\$776.80	\$1,163.20	\$3,548.00

Current AISH protects the first \$1,072 of employment income in full. Once earnings exceed that amount, the 50 percent band begins, and once earnings move above \$2,144 the effective 100 percent clawback zone creates a practical total-income ceiling.

Post-July 1, 2026 AISH assumption

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$415.68	\$1,874.32	\$65.68	\$2,290.00
10	\$692.80	\$1,597.20	\$342.80	\$2,290.00
15	\$1,039.20	\$1,250.80	\$689.20	\$2,290.00
20	\$1,385.60	\$904.40	\$1,035.60	\$2,290.00
25	\$1,732.00	\$558.00	\$1,382.00	\$2,290.00
30	\$2,078.40	\$211.60	\$1,728.40	\$2,290.00
35	\$2,424.80	\$0.00	\$2,074.80	\$2,424.80
40	\$2,771.20	\$0.00	\$2,421.20	\$2,771.20

This model is shown as an assumption rather than a confirmed government table. It keeps the \$1,940 base amount but assumes only a \$350 exemption and a 100 percent deduction above that point, which causes total income to flatten quickly and then track earnings once the benefit is exhausted.

Estimated ADAP Model A

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$415.68	\$1,740.00	\$0.00	\$2,155.68
10	\$692.80	\$1,740.00	\$0.00	\$2,432.80
15	\$1,039.20	\$1,655.20	\$84.80	\$2,694.40
20	\$1,385.60	\$1,557.26	\$182.74	\$2,942.86
25	\$1,732.00	\$1,418.70	\$321.30	\$3,150.70
30	\$2,078.40	\$1,256.38	\$483.62	\$3,334.78
35	\$2,424.80	\$1,065.86	\$674.14	\$3,490.66
40	\$2,771.20	\$839.16	\$900.84	\$3,610.36

Model A uses the original estimated ladder built from the public \$700 exemption and the public \$45,000 annual phase-out point. Its middle earnings range becomes progressively steeper, which is why the benefit column declines faster as earnings move deeper into the ladder.

Estimated ADAP Model B

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$415.68	\$1,740.00	\$0.00	\$2,155.68
10	\$692.80	\$1,740.00	\$0.00	\$2,432.80
15	\$1,039.20	\$1,689.12	\$50.88	\$2,728.32
20	\$1,385.60	\$1,625.82	\$114.18	\$3,011.42
25	\$1,732.00	\$1,521.90	\$218.10	\$3,253.90
30	\$2,078.40	\$1,394.22	\$345.78	\$3,472.62
35	\$2,424.80	\$1,238.34	\$501.66	\$3,663.14
40	\$2,771.20	\$1,046.28	\$693.72	\$3,817.48

Model B uses the same public anchors but a more gradual taper. The purpose is not to present it as a confirmed government design. The purpose is to test how a less abrupt phase-out path would change the income interactions if a final ADAP table were designed to reduce middle-range compression.

Comparison Table: Highest Total Income by Hour

Hours / week	Monthly earnings	Highest-income model	Top result	Margin over Current AISH
6	\$415.68	Current AISH	\$2,355.68	\$0.00
10	\$692.80	Current AISH	\$2,632.80	\$0.00
15	\$1,039.20	Current AISH	\$2,979.20	\$0.00
20	\$1,385.60	Current AISH	\$3,168.80	\$0.00
25	\$1,732.00	Current AISH	\$3,342.00	\$0.00
30	\$2,078.40	Current AISH	\$3,515.20	\$0.00
35	\$2,424.80	ADAP Model B	\$3,663.14	\$115.14
40	\$2,771.20	ADAP Model B	\$3,817.48	\$269.48

The comparison table identifies the model that produces the highest total income at each hour level. The margin-over-current-AISH column is included because current AISH is the most relevant baseline for many readers.

Key Takeaway Chart

The chart below gives a reader-friendly visual summary of the wage section. It shows where current AISH begins strong, where the post-2026 AISH assumption flattens quickly, and where the ADAP models become more competitive as hours increase.

At \$16 per hour, the chart makes the central pattern easier to see: low-hour protection tends to favor current AISH, while middle and higher-hour competitiveness tends to improve under the ADAP models, especially under Model B.

Interpretation and Public-Facing Takeaways

At \$16 per hour, current AISH remains strongest at the lowest hours because the first portion of earnings is fully protected. The post-July 1, 2026 AISH assumption is weaker at low and moderate hours because a worker leaves the protected band after only \$350 per month.

ADAP Model A and ADAP Model B are both lower than current AISH at very low hours in this wage band, but they behave differently once earnings move into the middle and upper rows. ADAP Model A first matches or exceeds current AISH at about 37 hours per week. ADAP Model B first matches or exceeds current AISH at about 32 hours per week.

ADAP Model A first matches or exceeds the post-2026 AISH assumption at about 8 hours per week. ADAP Model B first matches or exceeds the post-2026 AISH assumption at about 8 hours per week.

The main pattern to notice is where income growth slows. In current AISH, that slowdown becomes clear as earnings approach and then move beyond the 50 percent band into the effective 100 percent zone. In Model A and Model B, the slowdown is more gradual because the taper is distributed across a ladder, but the middle rows still matter because that is where clawbacks begin to accumulate meaningfully.

For public scrutiny, the important point is transparency. The tables in this section preserve the separate earnings, benefit, clawback, and total-income columns so the result is numerically auditable rather than impressionistic. That makes the section easier to test, dispute, or refine once more official numbers become available.

Wage Scenario: \$17 per hour

This section preserves the same broad analytical sequence throughout the report. It begins with a short legend and summary metrics, then presents each structure in a dedicated table before moving to comparison and interpretation. The repeated structure is intentional so the reader can move from one wage level to the next without having to relearn the format.

Color	Used for
Blue	Current AISH
Green	Post-July 1, 2026 AISH assumption
Rose	Estimated ADAP Model A
Lavender	Estimated ADAP Model B
Grey	Comparison and summary tables
Metric	Value
ADAP Model A vs current AISH crossover	About 35 hours/week
ADAP Model B vs current AISH crossover	About 31 hours/week
ADAP Model A vs post-2026 AISH assumption	About 8 hours/week
ADAP Model B vs post-2026 AISH assumption	About 8 hours/week
6 hours/week monthly earnings	\$441.66
10 hours/week monthly earnings	\$736.10

At \$17 per hour, 6 hours of work produces \$441.66 per month and 10 hours produces \$736.10. Those rows matter because they represent limited work capacity rather than assuming immediate movement into higher-hour employment.

Current AISH

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$441.66	\$1,940.00	\$0.00	\$2,381.66
10	\$736.10	\$1,940.00	\$0.00	\$2,676.10
15	\$1,104.15	\$1,923.92	\$16.08	\$3,028.07
20	\$1,472.20	\$1,739.90	\$200.10	\$3,212.10
25	\$1,840.25	\$1,555.88	\$384.12	\$3,396.12
30	\$2,208.30	\$1,339.70	\$600.30	\$3,548.00
35	\$2,576.35	\$971.65	\$968.35	\$3,548.00
40	\$2,944.40	\$603.60	\$1,336.40	\$3,548.00

Current AISH protects the first \$1,072 of employment income in full. Once earnings exceed that amount, the 50 percent band begins, and once earnings move above \$2,144 the effective 100 percent clawback zone creates a practical total-income ceiling.

Post-July 1, 2026 AISH assumption

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$441.66	\$1,848.34	\$91.66	\$2,290.00
10	\$736.10	\$1,553.90	\$386.10	\$2,290.00
15	\$1,104.15	\$1,185.85	\$754.15	\$2,290.00
20	\$1,472.20	\$817.80	\$1,122.20	\$2,290.00
25	\$1,840.25	\$449.75	\$1,490.25	\$2,290.00
30	\$2,208.30	\$81.70	\$1,858.30	\$2,290.00
35	\$2,576.35	\$0.00	\$2,226.35	\$2,576.35
40	\$2,944.40	\$0.00	\$2,594.40	\$2,944.40

This model is shown as an assumption rather than a confirmed government table. It keeps the \$1,940 base amount but assumes only a \$350 exemption and a 100 percent deduction above that point, which causes total income to flatten quickly and then track earnings once the benefit is exhausted.

Estimated ADAP Model A

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$441.66	\$1,740.00	\$0.00	\$2,181.66
10	\$736.10	\$1,730.97	\$9.03	\$2,467.07
15	\$1,104.15	\$1,638.96	\$101.04	\$2,743.11
20	\$1,472.20	\$1,522.62	\$217.38	\$2,994.82
25	\$1,840.25	\$1,375.40	\$364.60	\$3,215.65
30	\$2,208.30	\$1,184.93	\$555.07	\$3,393.24
35	\$2,576.35	\$975.56	\$764.44	\$3,551.90
40	\$2,944.40	\$717.92	\$1,022.08	\$3,662.32

Model A uses the original estimated ladder built from the public \$700 exemption and the public \$45,000 annual phase-out point. Its middle earnings range becomes progressively steeper, which is why the benefit column declines faster as earnings move deeper into the ladder.

Estimated ADAP Model B

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$441.66	\$1,740.00	\$0.00	\$2,181.66
10	\$736.10	\$1,734.59	\$5.42	\$2,470.68
15	\$1,104.15	\$1,679.38	\$60.62	\$2,783.53
20	\$1,472.20	\$1,599.84	\$140.16	\$3,072.04
25	\$1,840.25	\$1,489.42	\$250.57	\$3,329.68
30	\$2,208.30	\$1,335.76	\$404.24	\$3,544.07
35	\$2,576.35	\$1,163.19	\$576.81	\$3,739.54
40	\$2,944.40	\$942.36	\$797.64	\$3,886.76

Model B uses the same public anchors but a more gradual taper. The purpose is not to present it as a confirmed government design. The purpose is to test how a less abrupt phase-out path would change the income interactions if a final ADAP table were designed to reduce middle-range compression.

Comparison Table: Highest Total Income by Hour

Hours / week	Monthly earnings	Highest-income model	Top result	Margin over Current AISH
6	\$441.66	Current AISH	\$2,381.66	\$0.00
10	\$736.10	Current AISH	\$2,676.10	\$0.00
15	\$1,104.15	Current AISH	\$3,028.07	\$0.00
20	\$1,472.20	Current AISH	\$3,212.10	\$0.00
25	\$1,840.25	Current AISH	\$3,396.12	\$0.00
30	\$2,208.30	Current AISH	\$3,548.00	\$0.00
35	\$2,576.35	ADAP Model B	\$3,739.54	\$191.54
40	\$2,944.40	ADAP Model B	\$3,886.76	\$338.76

The comparison table identifies the model that produces the highest total income at each hour level. The margin-over-current-AISH column is included because current AISH is the most relevant baseline for many readers.

Key Takeaway Chart

The chart below gives a reader-friendly visual summary of the wage section. It shows where current AISH begins strong, where the post-2026 AISH assumption flattens quickly, and where the ADAP models become more competitive as hours increase.

At \$17 per hour, the chart makes the central pattern easier to see: low-hour protection tends to favor current AISH, while middle and higher-hour competitiveness tends to improve under the ADAP models, especially under Model B.

Interpretation and Public-Facing Takeaways

At \$17 per hour, current AISH remains strongest at the lowest hours because the first portion of earnings is fully protected. The post-July 1, 2026 AISH assumption is weaker at low and moderate hours because a worker leaves the protected band after only \$350 per month.

ADAP Model A and ADAP Model B are both lower than current AISH at very low hours in this wage band, but they behave differently once earnings move into the middle and upper rows. ADAP Model A first matches or exceeds current AISH at about 35 hours per week. ADAP Model B first matches or exceeds current AISH at about 31 hours per week.

ADAP Model A first matches or exceeds the post-2026 AISH assumption at about 8 hours per week. ADAP Model B first matches or exceeds the post-2026 AISH assumption at about 8 hours per week.

The main pattern to notice is where income growth slows. In current AISH, that slowdown becomes clear as earnings approach and then move beyond the 50 percent band into the effective 100 percent zone. In Model A and Model B, the slowdown is more gradual because the taper is distributed across a ladder, but the middle rows still matter because that is where clawbacks begin to accumulate meaningfully.

For public scrutiny, the important point is transparency. The tables in this section preserve the separate earnings, benefit, clawback, and total-income columns so the result is numerically auditable rather than impressionistic. That makes the section easier to test, dispute, or refine once more official numbers become available.

Wage Scenario: \$18 per hour

This section preserves the same broad analytical sequence throughout the report. It begins with a short legend and summary metrics, then presents each structure in a dedicated table before moving to comparison and interpretation. The repeated structure is intentional so the reader can move from one wage level to the next without having to relearn the format.

Color	Used for
Blue	Current AISH
Green	Post-July 1, 2026 AISH assumption
Rose	Estimated ADAP Model A
Lavender	Estimated ADAP Model B
Grey	Comparison and summary tables
Metric	Value
ADAP Model A vs current AISH crossover	About 33 hours/week
ADAP Model B vs current AISH crossover	About 29 hours/week
ADAP Model A vs post-2026 AISH assumption	About 8 hours/week
ADAP Model B vs post-2026 AISH assumption	About 8 hours/week
6 hours/week monthly earnings	\$467.64
10 hours/week monthly earnings	\$779.40

At \$18 per hour, 6 hours of work produces \$467.64 per month and 10 hours produces \$779.40. Those rows matter because they represent limited work capacity rather than assuming immediate movement into higher-hour employment.

Current AISH

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$467.64	\$1,940.00	\$0.00	\$2,407.64
10	\$779.40	\$1,940.00	\$0.00	\$2,719.40
15	\$1,169.10	\$1,891.45	\$48.55	\$3,060.55
20	\$1,558.80	\$1,696.60	\$243.40	\$3,255.40
25	\$1,948.50	\$1,501.75	\$438.25	\$3,450.25
30	\$2,338.20	\$1,209.80	\$730.20	\$3,548.00
35	\$2,727.90	\$820.10	\$1,119.90	\$3,548.00
40	\$3,117.60	\$430.40	\$1,509.60	\$3,548.00

Current AISH protects the first \$1,072 of employment income in full. Once earnings exceed that amount, the 50 percent band begins, and once earnings move above \$2,144 the effective 100 percent clawback zone creates a practical total-income ceiling.

Post-July 1, 2026 AISH assumption

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$467.64	\$1,822.36	\$117.64	\$2,290.00
10	\$779.40	\$1,510.60	\$429.40	\$2,290.00
15	\$1,169.10	\$1,120.90	\$819.10	\$2,290.00
20	\$1,558.80	\$731.20	\$1,208.80	\$2,290.00
25	\$1,948.50	\$341.50	\$1,598.50	\$2,290.00
30	\$2,338.20	\$0.00	\$1,988.20	\$2,338.20
35	\$2,727.90	\$0.00	\$2,377.90	\$2,727.90
40	\$3,117.60	\$0.00	\$2,767.60	\$3,117.60

This model is shown as an assumption rather than a confirmed government table. It keeps the \$1,940 base amount but assumes only a \$350 exemption and a 100 percent deduction above that point, which causes total income to flatten quickly and then track earnings once the benefit is exhausted.

Estimated ADAP Model A

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$467.64	\$1,740.00	\$0.00	\$2,207.64
10	\$779.40	\$1,720.15	\$19.85	\$2,499.55
15	\$1,169.10	\$1,622.72	\$117.27	\$2,791.82
20	\$1,558.80	\$1,487.98	\$252.02	\$3,046.78
25	\$1,948.50	\$1,327.83	\$412.18	\$3,276.32
30	\$2,338.20	\$1,113.49	\$626.51	\$3,451.69
35	\$2,727.90	\$869.47	\$870.53	\$3,597.37
40	\$3,117.60	\$596.68	\$1,143.32	\$3,714.28

Model A uses the original estimated ladder built from the public \$700 exemption and the public \$45,000 annual phase-out point. Its middle earnings range becomes progressively steeper, which is why the benefit column declines faster as earnings move deeper into the ladder.

Estimated ADAP Model B

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$467.64	\$1,740.00	\$0.00	\$2,207.64
10	\$779.40	\$1,728.09	\$11.91	\$2,507.49
15	\$1,169.10	\$1,669.63	\$70.36	\$2,838.73
20	\$1,558.80	\$1,573.86	\$166.14	\$3,132.66
25	\$1,948.50	\$1,452.67	\$287.32	\$3,401.18
30	\$2,338.20	\$1,277.31	\$462.69	\$3,615.51
35	\$2,727.90	\$1,072.26	\$667.74	\$3,800.16
40	\$3,117.60	\$838.44	\$901.56	\$3,956.04

Model B uses the same public anchors but a more gradual taper. The purpose is not to present it as a confirmed government design. The purpose is to test how a less abrupt phase-out path would change the income interactions if a final ADAP table were designed to reduce middle-range compression.

Comparison Table: Highest Total Income by Hour

Hours / week	Monthly earnings	Highest-income model	Top result	Margin over Current AISH
6	\$467.64	Current AISH	\$2,407.64	\$0.00
10	\$779.40	Current AISH	\$2,719.40	\$0.00
15	\$1,169.10	Current AISH	\$3,060.55	\$0.00
20	\$1,558.80	Current AISH	\$3,255.40	\$0.00
25	\$1,948.50	Current AISH	\$3,450.25	\$0.00
30	\$2,338.20	ADAP Model B	\$3,615.51	\$67.51
35	\$2,727.90	ADAP Model B	\$3,800.16	\$252.16
40	\$3,117.60	ADAP Model B	\$3,956.04	\$408.04

The comparison table identifies the model that produces the highest total income at each hour level. The margin-over-current-AISH column is included because current AISH is the most relevant baseline for many readers.

Key Takeaway Chart

The chart below gives a reader-friendly visual summary of the wage section. It shows where current AISH begins strong, where the post-2026 AISH assumption flattens quickly, and where the ADAP models become more competitive as hours increase.

At \$18 per hour, the chart makes the central pattern easier to see: low-hour protection tends to favor current AISH, while middle and higher-hour competitiveness tends to improve under the ADAP models, especially under Model B.

Interpretation and Public-Facing Takeaways

At \$18 per hour, current AISH remains strongest at the lowest hours because the first portion of earnings is fully protected. The post-July 1, 2026 AISH assumption is weaker at low and moderate hours because a worker leaves the protected band after only \$350 per month.

ADAP Model A and ADAP Model B are both lower than current AISH at very low hours in this wage band, but they behave differently once earnings move into the middle and upper rows. ADAP Model A first matches or exceeds current AISH at about 33 hours per week. ADAP Model B first matches or exceeds current AISH at about 29 hours per week.

ADAP Model A first matches or exceeds the post-2026 AISH assumption at about 8 hours per week. ADAP Model B first matches or exceeds the post-2026 AISH assumption at about 8 hours per week.

The main pattern to notice is where income growth slows. In current AISH, that slowdown becomes clear as earnings approach and then move beyond the 50 percent band into the effective 100 percent zone. In Model A and Model B, the slowdown is more gradual because the taper is distributed across a ladder, but the middle rows still matter because that is where clawbacks begin to accumulate meaningfully.

For public scrutiny, the important point is transparency. The tables in this section preserve the separate earnings, benefit, clawback, and total-income columns so the result is numerically auditable rather than impressionistic. That makes the section easier to test, dispute, or refine once more official numbers become available.

Wage Scenario: \$19 per hour

This section preserves the same broad analytical sequence throughout the report. It begins with a short legend and summary metrics, then presents each structure in a dedicated table before moving to comparison and interpretation. The repeated structure is intentional so the reader can move from one wage level to the next without having to relearn the format.

Color	Used for
Blue	Current AISH
Green	Post-July 1, 2026 AISH assumption
Rose	Estimated ADAP Model A
Lavender	Estimated ADAP Model B
Grey	Comparison and summary tables
Metric	Value
ADAP Model A vs current AISH crossover	About 32 hours/week
ADAP Model B vs current AISH crossover	About 27 hours/week
ADAP Model A vs post-2026 AISH assumption	About 7 hours/week
ADAP Model B vs post-2026 AISH assumption	About 7 hours/week
6 hours/week monthly earnings	\$493.62
10 hours/week monthly earnings	\$822.70

At \$19 per hour, 6 hours of work produces \$493.62 per month and 10 hours produces \$822.70. Those rows matter because they represent limited work capacity rather than assuming immediate movement into higher-hour employment.

Current AISH

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$493.62	\$1,940.00	\$0.00	\$2,433.62
10	\$822.70	\$1,940.00	\$0.00	\$2,762.70
15	\$1,234.05	\$1,858.97	\$81.02	\$3,093.02
20	\$1,645.40	\$1,653.30	\$286.70	\$3,298.70
25	\$2,056.75	\$1,447.62	\$492.38	\$3,504.38
30	\$2,468.10	\$1,079.90	\$860.10	\$3,548.00
35	\$2,879.45	\$668.55	\$1,271.45	\$3,548.00
40	\$3,290.80	\$257.20	\$1,682.80	\$3,548.00

Current AISH protects the first \$1,072 of employment income in full. Once earnings exceed that amount, the 50 percent band begins, and once earnings move above \$2,144 the effective 100 percent clawback zone creates a practical total-income ceiling.

Post-July 1, 2026 AISH assumption

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$493.62	\$1,796.38	\$143.62	\$2,290.00
10	\$822.70	\$1,467.30	\$472.70	\$2,290.00
15	\$1,234.05	\$1,055.95	\$884.05	\$2,290.00
20	\$1,645.40	\$644.60	\$1,295.40	\$2,290.00
25	\$2,056.75	\$233.25	\$1,706.75	\$2,290.00
30	\$2,468.10	\$0.00	\$2,118.10	\$2,468.10
35	\$2,879.45	\$0.00	\$2,529.45	\$2,879.45
40	\$3,290.80	\$0.00	\$2,940.80	\$3,290.80

This model is shown as an assumption rather than a confirmed government table. It keeps the \$1,940 base amount but assumes only a \$350 exemption and a 100 percent deduction above that point, which causes total income to flatten quickly and then track earnings once the benefit is exhausted.

Estimated ADAP Model A

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$493.62	\$1,740.00	\$0.00	\$2,233.62
10	\$822.70	\$1,709.33	\$30.68	\$2,532.03
15	\$1,234.05	\$1,606.49	\$133.51	\$2,840.54
20	\$1,645.40	\$1,453.34	\$286.66	\$3,098.74
25	\$2,056.75	\$1,268.29	\$471.71	\$3,325.04
30	\$2,468.10	\$1,042.05	\$697.95	\$3,510.14
35	\$2,879.45	\$763.38	\$976.62	\$3,642.84
40	\$3,290.80	\$452.82	\$1,287.18	\$3,743.62

Model A uses the original estimated ladder built from the public \$700 exemption and the public \$45,000 annual phase-out point. Its middle earnings range becomes progressively steeper, which is why the benefit column declines faster as earnings move deeper into the ladder.

Estimated ADAP Model B

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$493.62	\$1,740.00	\$0.00	\$2,233.62
10	\$822.70	\$1,721.60	\$18.41	\$2,544.30
15	\$1,234.05	\$1,659.89	\$80.11	\$2,893.94
20	\$1,645.40	\$1,547.88	\$192.12	\$3,193.28
25	\$2,056.75	\$1,403.96	\$336.04	\$3,460.71
30	\$2,468.10	\$1,218.86	\$521.14	\$3,686.95
35	\$2,879.45	\$981.33	\$758.67	\$3,860.78
40	\$3,290.80	\$711.90	\$1,028.10	\$4,002.70

Model B uses the same public anchors but a more gradual taper. The purpose is not to present it as a confirmed government design. The purpose is to test how a less abrupt phase-out path would change the income interactions if a final ADAP table were designed to reduce middle-range compression.

Comparison Table: Highest Total Income by Hour

Hours / week	Monthly earnings	Highest-income model	Top result	Margin over Current AISH
6	\$493.62	Current AISH	\$2,433.62	\$0.00
10	\$822.70	Current AISH	\$2,762.70	\$0.00
15	\$1,234.05	Current AISH	\$3,093.02	\$0.00
20	\$1,645.40	Current AISH	\$3,298.70	\$0.00
25	\$2,056.75	Current AISH	\$3,504.38	\$0.00
30	\$2,468.10	ADAP Model B	\$3,686.95	\$138.95
35	\$2,879.45	ADAP Model B	\$3,860.78	\$312.78
40	\$3,290.80	ADAP Model B	\$4,002.70	\$454.70

The comparison table identifies the model that produces the highest total income at each hour level. The margin-over-current-AISH column is included because current AISH is the most relevant baseline for many readers.

Key Takeaway Chart

The chart below gives a reader-friendly visual summary of the wage section. It shows where current AISH begins strong, where the post-2026 AISH assumption flattens quickly, and where the ADAP models become more competitive as hours increase.

At \$19 per hour, the chart makes the central pattern easier to see: low-hour protection tends to favor current AISH, while middle and higher-hour competitiveness tends to improve under the ADAP models, especially under Model B.

Interpretation and Public-Facing Takeaways

At \$19 per hour, current AISH remains strongest at the lowest hours because the first portion of earnings is fully protected. The post-July 1, 2026 AISH assumption is weaker at low and moderate hours because a worker leaves the protected band after only \$350 per month.

ADAP Model A and ADAP Model B are both lower than current AISH at very low hours in this wage band, but they behave differently once earnings move into the middle and upper rows. ADAP Model A first matches or exceeds current AISH at about 32 hours per week. ADAP Model B first matches or exceeds current AISH at about 27 hours per week.

ADAP Model A first matches or exceeds the post-2026 AISH assumption at about 7 hours per week. ADAP Model B first matches or exceeds the post-2026 AISH assumption at about 7 hours per week.

The main pattern to notice is where income growth slows. In current AISH, that slowdown becomes clear as earnings approach and then move beyond the 50 percent band into the effective 100 percent zone. In Model A and Model B, the slowdown is more gradual because the taper is distributed across a ladder, but the middle rows still matter because that is where clawbacks begin to accumulate meaningfully.

For public scrutiny, the important point is transparency. The tables in this section preserve the separate earnings, benefit, clawback, and total-income columns so the result is numerically auditable rather than impressionistic. That makes the section easier to test, dispute, or refine once more official numbers become available.

Wage Scenario: \$20 per hour

This section preserves the same broad analytical sequence throughout the report. It begins with a short legend and summary metrics, then presents each structure in a dedicated table before moving to comparison and interpretation. The repeated structure is intentional so the reader can move from one wage level to the next without having to relearn the format.

Color	Used for
Blue	Current AISH
Green	Post-July 1, 2026 AISH assumption
Rose	Estimated ADAP Model A
Lavender	Estimated ADAP Model B
Grey	Comparison and summary tables
Metric	Value
ADAP Model A vs current AISH crossover	About 30 hours/week
ADAP Model B vs current AISH crossover	About 26 hours/week
ADAP Model A vs post-2026 AISH assumption	About 7 hours/week
ADAP Model B vs post-2026 AISH assumption	About 7 hours/week
6 hours/week monthly earnings	\$519.60
10 hours/week monthly earnings	\$866.00

At \$20 per hour, 6 hours of work produces \$519.60 per month and 10 hours produces \$866.00. Those rows matter because they represent limited work capacity rather than assuming immediate movement into higher-hour employment.

Current AISH

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$519.60	\$1,940.00	\$0.00	\$2,459.60
10	\$866.00	\$1,940.00	\$0.00	\$2,806.00
15	\$1,299.00	\$1,826.50	\$113.50	\$3,125.50
20	\$1,732.00	\$1,610.00	\$330.00	\$3,342.00
25	\$2,165.00	\$1,383.00	\$557.00	\$3,548.00
30	\$2,598.00	\$950.00	\$990.00	\$3,548.00
35	\$3,031.00	\$517.00	\$1,423.00	\$3,548.00
40	\$3,464.00	\$84.00	\$1,856.00	\$3,548.00

Current AISH protects the first \$1,072 of employment income in full. Once earnings exceed that amount, the 50 percent band begins, and once earnings move above \$2,144 the effective 100 percent clawback zone creates a practical total-income ceiling.

Post-July 1, 2026 AISH assumption

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$519.60	\$1,770.40	\$169.60	\$2,290.00
10	\$866.00	\$1,424.00	\$516.00	\$2,290.00
15	\$1,299.00	\$991.00	\$949.00	\$2,290.00
20	\$1,732.00	\$558.00	\$1,382.00	\$2,290.00
25	\$2,165.00	\$125.00	\$1,815.00	\$2,290.00
30	\$2,598.00	\$0.00	\$2,248.00	\$2,598.00
35	\$3,031.00	\$0.00	\$2,681.00	\$3,031.00
40	\$3,464.00	\$0.00	\$3,114.00	\$3,464.00

This model is shown as an assumption rather than a confirmed government table. It keeps the \$1,940 base amount but assumes only a \$350 exemption and a 100 percent deduction above that point, which causes total income to flatten quickly and then track earnings once the benefit is exhausted.

Estimated ADAP Model A

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$519.60	\$1,740.00	\$0.00	\$2,259.60
10	\$866.00	\$1,698.50	\$41.50	\$2,564.50
15	\$1,299.00	\$1,590.25	\$149.75	\$2,889.25
20	\$1,732.00	\$1,418.70	\$321.30	\$3,150.70
25	\$2,165.00	\$1,208.75	\$531.25	\$3,373.75
30	\$2,598.00	\$960.40	\$779.60	\$3,558.40
35	\$3,031.00	\$657.30	\$1,082.70	\$3,688.30
40	\$3,464.00	\$305.60	\$1,434.40	\$3,769.60

Model A uses the original estimated ladder built from the public \$700 exemption and the public \$45,000 annual phase-out point. Its middle earnings range becomes progressively steeper, which is why the benefit column declines faster as earnings move deeper into the ladder.

Estimated ADAP Model B

Hours / week	Monthly earnings	Benefit	Clawback	Total income
6	\$519.60	\$1,740.00	\$0.00	\$2,259.60
10	\$866.00	\$1,715.10	\$24.90	\$2,581.10
15	\$1,299.00	\$1,650.15	\$89.85	\$2,949.15
20	\$1,732.00	\$1,521.90	\$218.10	\$3,253.90
25	\$2,165.00	\$1,355.25	\$384.75	\$3,520.25
30	\$2,598.00	\$1,150.20	\$589.80	\$3,748.20
35	\$3,031.00	\$890.40	\$849.60	\$3,921.40
40	\$3,464.00	\$579.15	\$1,160.85	\$4,043.15

Model B uses the same public anchors but a more gradual taper. The purpose is not to present it as a confirmed government design. The purpose is to test how a less abrupt phase-out path would change the income interactions if a final ADAP table were designed to reduce middle-range compression.

Comparison Table: Highest Total Income by Hour

Hours / week	Monthly earnings	Highest-income model	Top result	Margin over Current AISH
6	\$519.60	Current AISH	\$2,459.60	\$0.00
10	\$866.00	Current AISH	\$2,806.00	\$0.00
15	\$1,299.00	Current AISH	\$3,125.50	\$0.00
20	\$1,732.00	Current AISH	\$3,342.00	\$0.00
25	\$2,165.00	Current AISH	\$3,548.00	\$0.00
30	\$2,598.00	ADAP Model B	\$3,748.20	\$200.20
35	\$3,031.00	ADAP Model B	\$3,921.40	\$373.40
40	\$3,464.00	ADAP Model B	\$4,043.15	\$495.15

The comparison table identifies the model that produces the highest total income at each hour level. The margin-over-current-AISH column is included because current AISH is the most relevant baseline for many readers.

Key Takeaway Chart

The chart below gives a reader-friendly visual summary of the wage section. It shows where current AISH begins strong, where the post-2026 AISH assumption flattens quickly, and where the ADAP models become more competitive as hours increase.

At \$20 per hour, the chart makes the central pattern easier to see: low-hour protection tends to favor current AISH, while middle and higher-hour competitiveness tends to improve under the ADAP models, especially under Model B.

Interpretation and Public-Facing Takeaways

At \$20 per hour, current AISH remains strongest at the lowest hours because the first portion of earnings is fully protected. The post-July 1, 2026 AISH assumption is weaker at low and moderate hours because a worker leaves the protected band after only \$350 per month.

ADAP Model A and ADAP Model B are both lower than current AISH at very low hours in this wage band, but they behave differently once earnings move into the middle and upper rows. ADAP Model A first matches or exceeds current AISH at about 30 hours per week. ADAP Model B first matches or exceeds current AISH at about 26 hours per week.

ADAP Model A first matches or exceeds the post-2026 AISH assumption at about 7 hours per week. ADAP Model B first matches or exceeds the post-2026 AISH assumption at about 7 hours per week.

The main pattern to notice is where income growth slows. In current AISH, that slowdown becomes clear as earnings approach and then move beyond the 50 percent band into the effective 100 percent zone. In Model A and Model B, the slowdown is more gradual because the taper is distributed across a ladder, but the middle rows still matter because that is where clawbacks begin to accumulate meaningfully.

For public scrutiny, the important point is transparency. The tables in this section preserve the separate earnings, benefit, clawback, and total-income columns so the result is numerically auditable rather than impressionistic. That makes the section easier to test, dispute, or refine once more official numbers become available.

Cross-Over Summary by Wage

Hourly wage	ADAP A vs current AISH	ADAP B vs current AISH	ADAP A vs post-2026 AISH	ADAP B vs post-2026 AISH
\$15/hour	About 40 hrs/week	About 35 hrs/week	About 9 hrs/week	About 9 hrs/week
\$16/hour	About 37 hrs/week	About 32 hrs/week	About 8 hrs/week	About 8 hrs/week
\$17/hour	About 35 hrs/week	About 31 hrs/week	About 8 hrs/week	About 8 hrs/week
\$18/hour	About 33 hrs/week	About 29 hrs/week	About 8 hrs/week	About 8 hrs/week
\$19/hour	About 32 hrs/week	About 27 hrs/week	About 7 hrs/week	About 7 hrs/week
\$20/hour	About 30 hrs/week	About 26 hrs/week	About 7 hrs/week	About 7 hrs/week

The chart and table above compress the full report into a single crossover summary. The main practical takeaway is that Model B, because it uses a gentler taper than Model A, generally reaches parity with current AISH sooner.

Who Each Model Helps and Who It Hurts

Work-capacity profile	Most protective model	Key reason
6-10 hours/week	Current AISH	Large fully exempt band protects low earnings most effectively.
15-25 hours/week	Often Current AISH or close competition	Current AISH still protects lower and middle hours well, but ADAP becomes more competitive as earnings increase.
30-40 hours/week	ADAP Model A or B more often competitive	Current AISH eventually plateaus once the 100 percent clawback zone is reached, while ADAP can continue to rise.

Current AISH tends to help lower-hour workers most because its exemption is largest and its early clawback structure is less abrupt. The post-July 1, 2026 AISH assumption helps the narrowest group because it assumes only a very small protected band before full deduction. ADAP Model A helps higher-hour workers more than lower-hour workers because the current AISH line eventually plateaus while ADAP can continue to rise. ADAP Model B helps similar groups but becomes competitive somewhat sooner because the middle of the ladder is less steep.

Effective Work Incentive Interpretation

An important distinction in this report is the difference between a visible exemption and an effective work incentive. A program can have a visible no-clawback band and still produce weak incentives once earnings leave that band, if the middle of the ladder becomes too steep too quickly. That is why the analysis does not stop at the first threshold and instead tracks the full benefit and clawback path across multiple hours and wages.

Current AISH eventually creates a hard plateau because the effective 100 percent zone stops further total-income growth once the program has been clawed back enough. The post-2026 AISH assumption creates an even earlier flat zone. ADAP Model A and ADAP Model B can look weaker at low hours but stronger at higher hours because they keep allowing more total income growth beyond the point where current AISH has largely stopped increasing.

Income Plateau and Transition Risk Analysis

A plateau is a policy design feature with real practical effects. When one program structure stops allowing meaningful total-income growth after a certain point, the worker experiences higher effort with less visible improvement in final income. This can produce frustration, weak incentives, and a feeling that the system is punishing additional work rather than supporting it.

The chart above shows why transition design matters. Current AISH tends to be strongest at low hours, but once the effective 100 percent zone begins to dominate, further growth becomes limited. The ADAP models remain lower at first but can continue to rise for longer before reaching their own final phase-out point.

What Journalists and Advocacy Groups Are Likely to Focus On

Public-facing readers often focus on three things first: whether the lowest-hour workers lose protection, whether the middle of the ladder becomes too steep, and whether the stated policy language matches the lived effect of the model.

Journalists are likely to focus on stories of transition: who loses protection immediately, who appears unaffected on paper but faces steeper deductions later, and whether a program described as modernizing support actually improves work incentives for people with limited work capacity.

Advocacy groups are likely to focus on the lower-hour rows, because those rows better reflect intermittent or partial work capacity. They are also likely to examine whether one model effectively pressures people to increase hours in order to recover losses created by a smaller exemption or a harsher taper.

For that reason, the detailed wage tables in this report preserve the separate earnings, benefit, clawback, and total-income columns. Those columns make the public discussion easier to verify numerically rather than relying only on slogans or impressions.

Limitations of the Current Public Data

This report uses the best currently available public information, but it does not claim that every intermediate government parameter is known with certainty. The most important public anchors are the current AISH rules, the stated post-July 1, 2026 \$350 exemption assumption used here, the ADAP base amount of \$1,740, the ADAP monthly earnings exemption of \$700, and the public annual phase-out point of \$45,000.

What remains uncertain are the exact intermediate ADAP clawback steps and, for the post-July 1, 2026 AISH structure, the final officially released detailed rule table. That is why this report presents two ADAP scenarios rather than one and labels the post-2026 AISH design as an assumption where appropriate.

Overall Findings

All numbers shown in this report are calculated before taxes. The exact final ADAP structure is still unknown. The tables are intended to illustrate likely program interactions using the best currently available public information and a transparent set of modelling assumptions. Official program tables may change the results and will require reassessment once released.

The key analytical result is that the structure of the exemption and the shape of the middle clawback ladder matter as much as the base amount. A program can appear generous at the first threshold and still become restrictive in practice once earnings move further into the taper path.

Closing Note

This report is intended to provide a careful, readable, and policy-focused explanation of how currently known AISH and ADAP parameters could interact with employment income. It is designed to be readable by both technical reviewers and the general public, and it should be updated again once final government program tables are released.

The document is therefore best understood as a transparent modelling briefing rather than a final statement of official program design.
